Web appearance:

Link: https://www.daisie.com/

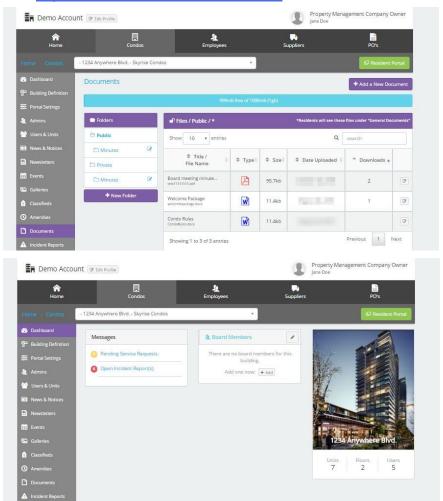

The website is a community website for sharing artwork from the "www.siteinspire.com." I found this website at the beginning of this semester. I get attracted by its layout, color, and font choice. I want to use this website as a guide for my project. The user can click the picture posted on the site, and they will see the art work's picture and a comment section. I will focus on introducing the homepage's color, layout, and font chosen. The theme color of this website is black and white. And there are some gray colors for the button and link. The homepage is a picture background and white title on the black background. The balck and white give people a pure feeling. The user will focus on the picture on the website. When you scroll down to the next screen, the background color becomes white. Even though it is a massive change in the background color from black and white. But the audience will not feel any uncomfortable. It is because of the author's layout. He is using a moving text line to separate two sections. Following the moving text line is a full-screen picture section. The picture section is kept refreshing. Hence the audience will not feel bored when they look at this website. The font selection is also impressive. The author uses thin and thick font-weight of the same font case. When different font-weight combining. The audience will pay more attention to the bolder font. For example, the title of the second screen. When the audience takes a first look, they will see the "connect," "130000", and "creators." And this is what the author is trying to show the website is connecting many people. All of these elements I can use in my project.

Condo management:

Link: https://www.condocommunities.com/#

The website is a commercial software to help better manage people's condo. As a business website, or we can call it a web application, the functionality is higher than the web art if you check the side menu at the left. You will see the different sections, such as dashboard, admins, users, notices, etc. The condo communities have a section called documents. When users register, they can choose to become users or administrators. The user can download or upload the document freely. They can set the authority of the document. For example, if they want to upload a document of renting a house, they will set the document to the public if they're going to upload a lease document for a specific person. The table on the right side of the screen will show the document's detail, such as title, type, size, date uploaded, etc. It is a convenient method to manage the document. The condo manager does not need to send financial reports to everyone by email. They can post the report on the site. And the user who has the authority can check it at any time. The other feature is the dashboard. The dashboard shows recent messages and requests. When the user clicks into the website, they can see all the recent messages request notification

directly. And It all in the link form; if they want to check the details, they just need to click the link. The dashboard is super convenience.

Forum functionality：

Link: https://www.reddit.com/ http://boards.4channel.org/co/

There's hundreds of forum on the internet. I choose two of them to be my research website. The website reddit is an american social news discussion website. It is super popular in the young man. As a discussion website, reddit performance super well. It allows the user to share their idea freely. The user will not only argue with other people about Donald Trump. They will also see some stupid memes or pictures depending on which topic are you watching. The functionality of this forum is super lovely. Especial the website's layout. It shows each user's replay and picture clearly. I can make something similar to it on my project. The other website 4chan, is also a forum. It is not a pretty website, but it funny and straightforward to use. As a simple image-based bulletin board it allows the user to share images and have a discussion on it. If you check this forum, you will find the atmosphere of this website is super chilling. And this is what I want to have on my project — a chilling feeling.

Project description:

I will not be able to make a website as good as a commercial one. So I decided to make a forum form the community website. The project will be a combination of the above three sites. It will not have a super-powerful feature, but it is enough to use. Users can create their account, and log in to the website. They can publish a post and comment owner's post. The site will have a dashboard for notification and requirements. And there will be a documentation part for the user to upload or download. The website will have an excellent outlay like the website 'daisie' (the first

website). So the website will not be super serious. As a forum, I hope users can have a chilling time when they discuss on the space. Meanwhile, the site can help them solve the condo problem. If I do not have enough time, I will not implement all these four features on my website.
